

```
#include <iostream>
```

```
using namespace std;
```

```
int main() {
```

```
    float roofArea, rainfall, efficiency;
```

```
    float collectedWater;
```

```
    // Input values
```

```
    cout << "Enter roof area (in square meters): ";
```

```
    cin >> roofArea;
```

```
    cout << "Enter annual rainfall (in millimeters): ";
```

```
    cin >> rainfall;
```

```
    cout << "Enter collection efficiency (in percentage): ";
```

```
    cin >> efficiency;
```

```
    // Convert efficiency percentage to decimal
```

```
    efficiency = efficiency / 100;
```

```
    // Calculate collected rainwater
```

```
    // Formula:
```

```
    // Water Collected (liters) = Roof Area × Rainfall × Efficiency
```

```
    collectedWater = roofArea * rainfall * efficiency;
```

```
    // Output result
```

```
    cout << "\nPotential Rainwater Collected: "
```

```
        << collectedWater << " liters" << endl;
```

```
    return 0;
```
